INS07-70000	INNOVA-T TECHNICAL LIGHTENED FIBER-REINFORCED CONCRETE SLAB	2000 x 1200 x 12,5 mm	0	120	M2

### Description

Extremely light fiber-reinforced concrete slab, extremely easy to cut, insulating and water resistant. Ideal solution for both internal and external structures, it does not deform or break. One of the 2 sides is covered with a layer of glass veil.

### Material

Lightened Fiber-reinforced concrete slab

### Use

INNOVA-T slab is the ideal solution for partition walls, false ceilings, dry screeds, or dry environments for energy requalification building. It can be applied both on wooden and steel structures, and also guarantees excellent support for the application of various types of tiles or bricks. The slab has two different sides: Smooth side (coated with glass veil): this is the side for direct painting on the slab (plastering on the joints only). We recommend to cut the slab on this side and when the slab is applied externally, this side must be turned inwards. Rough side: this is the side where apply the glue or for direct plastering, and for this reason it is the side that must be turned outwards when applied outdoors.
